1. Field of the Invention This invention relates to a disc apparatus with a drive. In particular, it relates to a disc apparatus with a drive that can be detachably loaded onto a disc apparatus body. 2. Description of the Prior Art Disc apparatus capable of reading/writing data from and to a disc-shaped recording medium, such as an optical disc, have conventionally been proposed. Also, mini disc apparatus are also put to practical use. The mini disc is provided with a spiral groove for tracking, and a thin metal film formed on the disc surface and used as a recording film. If pits formed in advance in the groove are irradiated with a laser beam, data can be written in the recording film in accordance with the length of each pit. In case of reproduction, a laser beam is focused on the recording film, and if the light reflected therefrom is detected, data can be read out. In the above-mentioned disc apparatus, the disc is rotated by a motor. In case of data read/write, read/write means is caused to be close to the disc surface, and the laser beam is caused to be illuminated through the disc. Also, data is recorded in the disc, and data read is carried out in the same way as above. It is to be noted that an optical unit is mounted on a base, the base is movably inserted in an apparatus housing, and thus the optical unit is moved by the insertion of the base in the apparatus housing. Also, when the base is moved in

---

and out of the apparatus housing, an electrical unit is moved by the movement of the base along with the optical unit and the disc, and therefore the electrical unit is likely to be contaminated. To avoid this, an electrical unit is provided with a movable connector, and a connector provided on the base is connected to the movable connector of the electrical unit. Thus, if the base is moved in and out of the apparatus housing, the electrical unit can be moved while the connectors are kept away from each other, thereby reducing the possibility of contamination of the electrical unit. However, in case of moving the base in and out of the apparatus housing, only mechanical components are moved, and no electrical components are moved. Therefore, in order to move the electrical unit along with the base, it is necessary to use a complicated mechanical device and an electrical device.
